1. EXPLANATION AND REASON OF STRATEGY:

The indication which i use in my strategy is:

1. SMA (Simple Moving Average)

Think of SMA as the **average closing price of a stock over a set number of days**, like 30 or 90, which i use in my strategy.

It smooths out the daily ups and downs so you can see the overall trend more clearly

 **Why it is useful (reason):** It helps investors identify if a stock is generally trending up, down, or sideways.

2. RSI (Relative Strength Index)

RSI is like a **speedometer for a stock's price movements** — it tells you if it's moving too fast and might need to slow down and also for identification of revision of trend.

It measures how **"overbought"** (too many buyers, might fall soon) or **"oversold"** (too many sellers, might rise soon) a stock is, on a scale of 0 to 100.

Above 70 = might be too hot.

Below 30 = might be too cold.

 **Why it is useful (reason):** Helps spot when a trend might be reversion..

3. EMA (Exponential Moving Average)

EMA is like SMA's smarter cousin. It also tracks average prices, but it **gives more weight to recent prices**.

So if something just changed in the market, the EMA reacts faster than the SMA

 **Why it is useful (reason):** Traders use it for faster signals to enter or exit a trade.

4. ADX (Average Directional Index)

ADX doesn't care if prices are going up or down — it just tells you **how strong the trend is**.

It's like checking how strong the wind is, not the direction it's blowing. A reading above 25 means the trend (up or down) is strong. Below that? The market might just be wandering aimlessly.

 **Why it is useful (reason):** It helps you avoid trading in choppy, no-direction zones.

Absolutely! Let's break down **DI+ (Plus Directional Indicator)** and **DI- (Minus Directional Indicator)** in a **human-friendly** way, continuing with the finance context.

DI+ (Plus Directional Indicator)

Think of **DI+** as a tracker for **upward strength**.

It measures **how strongly buyers are pushing prices upward**.

 If **DI+** is high, it means the price is making higher highs — bulls (buyers) are in control, and the stock is climbing with force.

DI- (Minus Directional Indicator)

Now, **DI-** is just the opposite — it measures **how strongly sellers are pushing prices downward**.

 If **DI-** is high, it means the price is making lower lows — bears (sellers) are in control, and the stock is falling with momentum.

- When **DI+ is above DI-**, the bulls are stronger → **possible uptrend**.
- When **DI- is above DI+**, the bears are stronger → **possible downtrend**.
- When they're close together or crisscrossing a lot, the market might be **sideways or indecisive**.

Why it is useful (reason) :

Traders often use the **crossover between DI+ and DI-** as a signal to buy or sell. Combined with **ADX** (which tells you the strength of the trend), you get a fuller picture:

- **ADX high + DI+ > DI-** = strong uptrend.
 - **ADX high + DI- > DI+** = strong downtrend.
-

5. Bollinger Bands

Imagine a stock's price walking a tightrope. The Bollinger Bands are **rubber bands around the price**, showing how wild or calm the market is.

There's a middle line (a moving average), and two bands that expand or contract based on price volatility.

When the bands are tight = calm market.

When they're wide = high volatility.

 **Why it is useful (reason):** If prices hit the upper or lower band, it might be a sign of reversal or breakout.

I use this indicator on basis of above mention reason

Now it's time for strategy explanation

Overall Strategy Structure

This is a trend-based and mean-reversion based trading strategy using:

- **ADX** for trend strength
- **DI+ and DI- crossovers** for trend direction
- **RSI** and **SMA crossovers** for momentum
- **Bollinger Bands** (price vs upper/lower bands) for volatility signals
- Basic **stop-loss (SL)** and **take-profit (TP)** risk controls

1. If $ADX > 25 \rightarrow$ A strong trend exists

Within this strong trend, we check who's stronger: **buyers (DI+)** or **sellers (DI-)**.

If DI+ crosses above DI- (bullish signal):

- If we don't already have a position, **buy**.
- If we already have a position (could be sell or buy), **close it and re-enter a buy** (maybe reversing a short).

If DI- crosses above DI+ (bearish signal):

- If we don't have a position, **sell**, with a **take-profit at 90% of the current price** (expecting a 10% drop).
- If we already have a position, **close it and sell again**.

```
if (ADX>25) :
    if((crossover(self.DIP, self.DIN))):
        if(not(self.position)):
            self.buy()
        elif((self.position)):
            self.position.close()
            self.buy()

    elif (crossover(self.DIN, self.DIP)):
        if(not(self.position)):
            # tp=price*0.9
            self.sell()
        elif((self.position)):
            self.position.close()
            self.sell()
```

If $ADX < 20 \rightarrow$ Weak or no trend

- Close any existing position — no clear trend means it's risky to stay in the market.

```

        self.sell()
    elif(ADX<20):
        if (self.position):
            self.position.close()

```

Other Situations — Independent Signals

These rules apply **regardless of ADX**, and look for **momentum or reversal** signals using RSI, SMA, and Bollinger Bands.

▲ If price crosses above the upper Bollinger Band OR RSI crosses above its upper bound:

- **Sell** — the stock may be overbought or overextended.

```

if crossover(self.upper,price)|crossover (self.rsi,self.upper_bound_RSI):
    self.sell()

```

▼ If RSI crosses above its lower bound OR (short SMA crosses above long SMA AND RSI is not overbought) OR price crosses above the lower Bollinger Band:

- **Buy**, with:
 - **Stop-loss** set at 95% of the current price (in case it drops)
 - **Size** of 0.8 (not full position, likely a more cautious entry)

```

        elif crossover(self.lower_bound_RSI,self.rsi) or((crossover(self.short_sma,self.long_sma1)&(self.rsi<self.upper_bound_RSI))|crossover(price,self.lower))
            sl=price*0.95
            size=.8
            self.buy(size=size,sl=sl)

```

 If long SMA crosses above short SMA AND RSI is still not overbought:

- **Close the position** — this may signal the bullish momentum is fading.

```

        self.buy(size=size,sl=sl)
    elif (crossover(self.long_sma1,self.short_sma)&(self.rsi<self.upper_bound_RSI)):
        self.position.close()

```

🧠 Summary :

- **Only trade when there's a strong trend** ($ADX > 25$).
 - Buy if buyers are gaining control.
 - Sell if sellers are gaining control.
 - **Exit trades if there's no clear trend** ($ADX < 20$).
 - Use **RSI, SMA, and Bollinger Bands** for additional buy/sell signals — especially in volatile or overbought/oversold conditions.
 - **Protect trades** with stop-loss (for buys) and take-profit (for sells).
-
